

Strategic Partnership between Europêche and Waste Free Oceans

Media Coverage Report

World

Created on Monday, 02 March 2015 16:06 |  | 

EUROPECHE, which represents 80,000 European fishermen, has teamed up with the environmental group Waste Free Oceans (WFO) to help combat the growing issue of marine litter.

At a meeting between the two organisations held this week in Brussels, Européche pledged to work with its member organisations to raise awareness of the issue and encourage fishermen across Europe to get involved in clean up initiatives.

Across Europe, fishermen have taken part in initiatives such as the 'Fishing for Litter' scheme in the UK and the Isla Verde project in Spain which aim to keep the oceans as litter and pollutant-free as possible. These initiatives have seen fishermen collecting and disposing of their waste – including plastics, ropes and fishing nets – when back on land as well as participating in clean-up efforts in particularly badly affected areas.

The pledge comes in the same week as new research, published by the University of Georgia, revealed that about eight million tonnes of plastic waste are dumped in the world's oceans each year and this could rise to a total of 155 million tonnes entering the oceans by the year 2025.

Europêche, which represents both small and large scale fishing vessels from nine European countries, says the aim of the partnership is to encourage fishermen and the plastics industry to work together to prevent marine littering and proactively clear plastics in the ocean.

President of Europêche, Javier Garat, said: "We welcome this partnership to raise awareness of the issue and what fishermen themselves can do to help. It will also allow fishermen to assist research into better tracing of marine litter. Whilst we are aiming to help prevent waste ending up in our oceans in the first place, our fishermen can positively contribute to the clean-up effort towards more environmentally friendly European waters."

Under the general framework of promoting sustainable fishing activities, funding may become available from the European Maritime and Fisheries Fund (EMFF) to support fishermen taking part in projects contributing to the preservation of oceans.

There are many factors which have contributed to a rise in marine litter over the last 20 years including a significant rise in plastic production, poor waste management practices in ports and marinas and general public attitudes towards littering.

An increase in marine litter would have major implications for both human health and marine ecosystems. Problems caused by marine litter can include entanglement, ingestion or transport of invasive species, all of which are harmful to fish stocks.

Europêche has pledged its committed to supporting these actions and believes all fishermen should be informed of the significant role they can play in not only taking precautions against littering but also actively engaging in projects to proactively protect the environment.

Fresh efforts on marine litter

European Parliament fisheries committee member Ian Hudghton has welcomed renewed efforts at European level to combat the issue of marine litter in Europe.

The partnership of Europêche and Waste Free Oceans (WFO) will encourage fishermen and the plastics industry to work together to prevent marine littering and proactively clear plastics in the ocean.

The SNP MEP said on Friday: "I welcome this new effort from Europêche and WFO to tackle the ongoing problem of litter in seas across Europe. Last year the Scottish government launched a national marine litter strategy with the aim of promoting sustainable use of our valuable and unique marine environments.

"These combined efforts at an EU level and through national governments will advance the preservation of Europe's seas and encourage fishermen to take part in projects targeted at cleaning our oceans."

The marine litter strategy is intended to cut the amount of litter entering the marine and coastal environment, bringing "ecological, economic and social benefits, meeting the long term needs of people and nature."

It underpins developments in marine legislation through the Marine (Scotland) Act 2010 in promoting sustainable use of the "valuable and unique environment".

The development and implementation of the strategy will be led by Marine Scotland.

MEP Ian Hudghton welcomes fresh moves to tackle marine littering.

Fishermen in ocean clean-up initiative

Posted on March 5, 2015 by hannahm — No Comments ↓

[Europêche](#), the Association of National Organisations of Fishing Enterprises in the EU, has joined forces with [Waste Free Oceans](#) (WFO) to help combat the pollution and littering of the sea.

The recent rise in plastic production, as well as poor waste management in ports and public attitudes towards littering are all factors that have contributed towards the increase in marine litter. [This rise in litter is already having an impact on the ecosystem](#), and a further increase would have major implications for marine – and human – health.

Europêche, which represents 80,000 European fishermen, has vowed to support WFO in their work, and say they believe that all fishermen should be informed of the importance of their actions in not only preventing littering, but also actively engaging in projects alongside the plastics industry to protect the environment.

Javier Garat, the president of Europêche, said: "We welcome this partnership to raise awareness of the issue and what fishermen themselves can do to help. It will also allow fishermen to assist research into better tracing of marine litter. Whilst we are aiming to help prevent waste ending up in our oceans in the first place, our fishermen can positively contribute to the clean-up effort towards more environmentally friendly European waters."

Under the general framework of promoting sustainable fishing activities, fishermen taking part in projects contributing to the preservation of oceans may be able to get funding from the European Maritime and Fisheries Fund.

Europêche y el grupo ambientalista WFO se alían para combatir la problemática de la basura marina

05/03/2015 - 19:10

La organización europea **Europêche**, que representa a 80.000 pescadores europeos, se ha unido al grupo ambientalista **Waste Free Oceans (WFO)** para combatir la problemática creciente de la basura marina. De hecho, el último informe sobre contaminación de los océanos de la Universidad de Georgia (EEUU) revela que cada año se tiran a los océanos alrededor de 8 millones de toneladas de plásticos. El mismo estudio apunta que esta cantidad ascenderá a 155 millones de toneladas en 2025, si no se pone remedio.

La principal novedad del acuerdo ahora firmado en Bruselas es la implicación de los pescadores en las labores de prevención y limpieza. España y Reino Unido ya han participado en iniciativas similares a través de los programas Isla Verde (desarrollado en España por la Cooperativa de Armadores de Vigo – ARVI) y *Fishing for Litter*, respectivamente. Estas iniciativas implican la recogida y retirada de desperdicios como plásticos, cuerdas y redes de pesca cuando los barcos llegan a puerto, así como la participación en acciones de limpieza, particularmente en las áreas especialmente afectadas.

Europêche, que representa tanto a barcos de pequeño tamaño como a grandes buques de nueve países europeos, ha manifestado que el objetivo de esta alianza es fomentar el trabajo conjunto de los pescadores y la industria del plástico para prevenir y eliminar proactivamente este tipo de contaminación de los océanos.

Por su parte, la Confederación Española de Pesca (CEPESCA), miembro de Europêche, trasladará este mismo acuerdo a España, a través de sus miembros asociados.

Según el presidente de Europêche, Javier Garat, *“este acuerdo, además de involucrar a los propios pescadores en las tareas de concienciación y limpieza, también va a implicarles en las investigaciones dirigidas a mejorar la localización de la basura marina”*.

Bajo el marco general para la promoción de las actividades de pesca sostenible, el Fondo Europeo Marítimo y de Pesca (FEMP) financiará a las pesquerías que participen en proyectos que contribuyan a la preservación de los océanos.

Existen varios factores que han contribuido al incremento durante los últimos 20 años de la basura marina, incluyendo un aumento significativo de la producción de plástico, malas prácticas en la gestión de estos residuos en puertos comerciales y deportivos, así como actitudes poco respetuosas de la población.

El aumento de la basura marina puede tener implicaciones de alcance tanto para la salud humana como para los ecosistemas marinos. Entre los problemas que provoca, se incluyen el enredamiento de peces y otros animales marinos, la ingestión de plásticos por parte de éstos o el transporte de especies invasoras entre ecosistemas, con consecuencias dañinas para los stocks de pesca.

European fishermen reduce accumulation of marine debris

Posted by: Peru Pesquero in Editorial, International, National, News, Fishery, Policy, Regional 4 days ago 0 52 Views

The agreement with the NGO WFO involves the fishing fleet in cleanup and investigation

European fishermen have pledged to reduce the accumulation of marine debris, after the agreement signed by the owners of the European Union (grouped in the Européche association) and the NGO Waste Free Oceans (WFO). The agreement directly involves performing on awareness raising, cleaning and research. "The goal of this partnership is to promote the joint work of the fishermen and the plastics industry to prevent and eliminate this pollution of the oceans" Said the President of Européche and CEPESCA, Javier Garat.

The pact includes the collection and removal of waste such as plastics, ropes and fishing nets when ships arrive in port as well as participation in cleanup actions, particularly in the areas particularly affected. The initiative can count on support from the European Maritime Fisheries Fund.

Europeche and environmental group facing marine waste issue

EUROPEAN UNION

Friday, March 06, 2015, 09:40 (GMT + 9)

The European organization [Europeche](#), which represents 80,000 European fishermen, has joined the environmental group Waste Free Oceans (WFO) to combat the growing marine waste issue.

According to the latest report on ocean pollution issued by the University of Georgia (US), each year around 8 million tonnes of plastic material is dumped into the oceans, and this amount will rise to 155 million tonnes in 2025, if no solution is found.

The main novelty of the newly settled agreement in Brussels is the involvement of fishermen in prevention and cleaning labour. Spain and the UK have already participated in similar initiatives across Isla Verde programmes (developed in Spain by the [Cooperative of Shipowners of Vigo - ARVI](#)) and Fishing for Litter, respectively. These initiatives involve collecting and removing waste such as plastic, ropes and fishing nets when ships arrive in port as well as the participation in cleanup actions, particularly in the areas that have been especially affected.

Europeche, representing both small boats and large ships from nine European countries, said that the goal of this partnership is to encourage the joint effort of fishermen and the plastic sector to proactively prevent and eliminate such pollution of the oceans.

For its part, the [Spanish Fisheries Confederation \(CEPESCA\)](#), a member of Europeche, will transfer the same agreement to Spain through its associate members.

Europeche's president, Javier Garat, considers that "apart from involving the fishermen themselves in tasks intended to raise awareness and carry out cleaning efforts, this agreement will also involve them in research aimed at improving marine debris spotting tasks".

Under the general framework for the promotion of sustainable fishing activities, the European Maritime and Fisheries Fund (EMFF) will offer financial support to the fisheries involved in projects that contribute to the preservation of the oceans.

Several factors have contributed to the increase of marine debris in the last 20 years, including a significant increase in plastic production, bad practice in the management of waste in commercial ports and marinas and disrespectful attitudes of the population.

Increased marine debris can have far-reaching implications for both human health and marine ecosystems. Among the problems it causes are the entanglement of fish and other marine animals, their intake of plastic material or transporting invasive species from ecosystem to another one, with damaging consequences for fishing stocks.

European fishermen and WFO pledge to eliminate marine litter

The 'Fishing for Litter' scheme is one of many that aim to tackle the growing problem of marine litter.

Europêche, the body representing 80,000 European fishermen, and environmental group Waste Free Oceans (WFO) have pledged to work together to help combat the growing issue of marine litter.

At a meeting between the two organisations held this week in Brussels, Europêche pledged to work with its member organisations to raise awareness of the issue and encourage fishermen across Europe to get involved in clean up initiatives, such as 'Fishing for Litter' and collect and dispose of any waste – including plastics, ropes and fishing nets – on shore.

President of Europêche, Javier Garat, said: "We welcome this partnership to raise awareness of the issue and what fishermen themselves can do to help. It will also allow fishermen to assist research into better tracing of marine litter. Whilst we are aiming to help prevent waste ending up in our oceans in the first place, our fishermen can positively contribute to the clean up effort towards more environmentally friendly European waters."

EUROPEAN FISHERMAN AND WFO PLEDGE TO ELIMINATE MARINE LITTER

4TH MARCH 2015 IN EUROPECHE, SUSTAINABILITY / ENVIRONMENT

Europêche, the body representing 80,000 European fishermen, has teamed up with environmental group, Waste Free Oceans (WFO) to help combat the growing issue of marine litter.

At a meeting between the two organisations held this week in Brussels, Europêche pledged to work with its member organisations to raise awareness of the issue and encourage fishermen across Europe to get involved in clean up initiatives.

Across Europe, fishermen have taken part in initiatives such as the 'Fishing for Litter' scheme in the UK and the Isla Verde project in Spain which aim to keep the oceans as litter and pollutant-free as possible. These initiatives have seen fishermen collecting and disposing of their waste including plastics, ropes and fishing nets when back on land as well as participating in cleanup efforts in particularly badly affected areas.

The pledge comes in the same week as new research, published by the University of Georgia, USA, revealed that about eight million tonnes of plastic waste are dumped in the world's oceans each year which if left uncontrolled, will amount a total of 155 million tonnes entering the oceans by the year 2025.

Europêche, which represents both small and large scale fishing vessels from nine European countries, says the aim of the partnership is to encourage fishermen and the plastics industry to work together to prevent marine littering and proactively clear plastics in the ocean.

President of Europêche, Javier Garat, said: "We welcome this partnership to raise awareness of the issue and what fishermen themselves can do to help. It will also allow fishermen to assist research into better tracing of marine litter. Whilst we are aiming to help prevent waste ending up in our oceans in the first place, our fishermen can positively contribute to the clean up effort towards more environmentally friendly European waters." Under the general framework of promoting sustainable fishing activities, funding may become available from the European Maritime and Fisheries Fund (EMFF) to support fishermen taking part in projects contributing to the preservation of oceans.

There are many factors which have contributed to a rise in marine litter over the last 20 years including a significant rise in plastic production, poor waste management practices in ports and marinas and general public attitudes towards littering.

An increase in marine litter would have major implications for both human health and marine ecosystems. Problems caused by marine litter can include entanglement, ingestion or transport of invasive species, all of which are harmful to fish stocks.

Europêche has pledged its committed to supporting these actions and believes all fishermen should be informed of the significant role they can play in not only taking precautions against littering but also actively engaging in projects to proactively protect the environment.
